

# Warwick Whips

## And Leather Repairers

### Whip Care

1. Always wipe your whip with a soft cloth after each use, especially in wet weather.
2. About once a month give the whip a thorough rubbing with a good quality leather dressing, rub in well and leave overnight. Wipe off any excess in the morning. We suggest a soft cream type leather conditioner.
3. Give the fall extra attention as it is the working end of the whip so is the part designed to get damaged. The fall will get hard and dry with use. This is meant to happen. To prolong its life we suggest you use olive oil each time the fall gets wet which will stop it getting hard and prevent breaking.
4. Do not use any leather dressing on the cracker as it does not need it.
5. Never put your whip in front of a fire or a heater to dry it - this will cause damage to the leather.
6. If your whip gets wet, wipe dry with a soft cloth and give it a good rubbing with leather dressing.
7. Do not put leather dressing on the handle as this will make it slippery and dangerous and it may slip out of your hand when in use.
8. Do not roll your whip into a small loop as this will make it loose and hard to crack - roll your whip into one loop and use the fall to tie to the handle.

### Whip Safety

1. Always make sure that no one is near you when you are cracking your whip.
2. Never crack your whip at someone as it can cut skin or break bones.

Note: The whip makes the crack sound because the small piece of nylon cracker breaks the sound barrier. The crack sound is a small sonic boom just like a jet plane going through the sound barrier but on a much smaller scale.

**So always be careful when using your whip.**
